One command tells you if the hardware is capable of running 64-bit. The other tells you which kernel is running (32 or 64-bit).

The -K is the "which kernel is running" I believe. The -y is "What about the hardware"

Allright, so clear this up for me.

One suggestion is "bootinfo -K". This tells me 32.
The other suggestion is "bootinfo -y". This tells me 64.

Neither of these switches seem to be documented in the man pages, so please explain what these do.

Thanks,
Eric

Subject: Kernel

What is the command to find out that you are running 32-bit kernel or 64 bit kernel.....

Thanks

Jai Rangi
