I tried to migrate a CWS yesterday, an F50, from AIX433-08 & PSSP32 to AIX51-04 and PSSP35.

Shortly after the migration kicked off, it failed, reporting problems with rpm.rte. After poking around for a bit we abandoned the migration and restored from a mksysb.

The problem seems to have been the existence in the 433 system of /usr/opt/freeware, which as far as I can tell contains all the components of rpm.rte, but rpm.rte is not installed, (according to lslpp).

As far as I'm aware, nobody has ever fooled with the AIX Toolbox for Linux on this system. I've got the same situation on two other servers in this cluster.

Can anyone suggest how and why these files might have gotten there?
