We have a time server set up on a IBM mainframe running VM. All of our PCs synch their clocks to the mainframe. We want to do this with our Notes server (AIX 5L) as well. I've started timed, but it does not seem to find the mainframe as a time server. I've used timedc to try to elect the mainframe as the master time server – I don't get any errors, but the Notes server still does not synch its clock. When I try to request the time difference between the two machines using timedc, I get a valid response back from the mainframe and it shows the correct time difference. When I try to find the master time server with timedc I get a "communication error" message. Does anyone have any ideas on how to get this to work?
