You haven't mentioned whether you verified that the output from the no command on the production box and clone show any discrepancies. When we cloned an S80 (that was SP-attached) to an H70 (stand-alone), our throughput declined dramatically as well. We discovered that several values established by the system for the H70 were dramatically different than those in place for the S80 (which may have been enhanced by being a pseudo-SP node). Just a thought
