There are some good Redbooks on the subject.

Got apache install, but no where to find a README file
or how do I get it started?

Subject: Re: aix 5.2 and httpd question

okay, if you want to run a webserver on the box, i think you can get a
compiled copy of apache from www.bullfreeware.com. this file will come as
an executable. set the file permissions on it: "chmod u+x *.exe". i
normally do such things in a directory i create under /tmp called install.
so you'd get the file to /tmp/install, do the chmod, then ./apachexxx.exe
(whatever version you pick). that will create one or more .bff files. then
run "inutoc" to create the .toc file. then type smit install and when you
get to the location, put in /tmp/install. i always go down to where it says
_all_latest_ and hit f4, to make sure the .toc is readable. bull's stuff
normally lands in /usr/local.
