> *Anyone have any past experience with Pick?*

For pick specific questions, you could try the comp.databases.pick newsgroup. Someone there will have optimised this combination previously. You may want to find out precisely which "Pick" you are running --- there are many different implementations even from individual vendors. Some of the other implementations have their own mailing lists.

Depending on the processing style, you may be able to separate select list data (temporary files created during processing) onto a separate lv from the database but I don't know how well this would work with genuine Pick as we use UniVerse which is an alternative implementation.

Pick uses hashed files so you could also check that all the files are sized correctly as this will dramatically affect I/O.
