writesrv is a daemon part of the spooler subserver and its purpose is to allow users to send messages to and receive messages from a remote system.

Subject: writesrv

I have a Notes E-Mail system running on an AIX 4.3.3 (ML08) server. CPU utilization is very, very high (80-90 % CPU utilization).
/usr/sbin/writesrv seems to be the culprit. What is writesrv and has anyone else experienced a similar problem?
