For the archive (compiled from information given by Bill Versal and Juan Camilo Yanquen):

To report the conection address when using ssh, you need to update openssh above 3.8.1, and, as a prerequisite, to update openssl above 0.9.7.

- \* Backup /etc/ssh
- \* Stop the ssh service (stopsrc -s sshd)
- \* Update the openssl to 0.9.7d
- \* Update the openssh to 3.8.1p1
  - \* rpm -Uvh openssl\*
  - \* Uncompress openssh
  - \* Inutoc and smitty update\_all
  - \* make a /var/empty dir, and /var/empty/sshd with 111 permissions
  - \* If needed, restore /etc/ssh
- \* Restart the service (startsrc -s sshd)

This version of openssh give the IP address as it should.
