The script `cfg2html` produces a significant amount of configuration information; it should be available from a yahoo group.

Subject: System Info Script

Hello

I am looking at putting together a script that I can run monthly that will give me a system information report for our AIX systems. This report will be used if there is a disaster. Basically, I want it to include all the information necessary to recover the server in the event of a disaster, like volume group config, logical volume config, file system config, etc.

I was wondering if anyone out there has a script like this and is willing to share?

Thanks!
