I have a question for those running IBM with EMC disk. We installed powerpath on the server and went to create VG's. In smit I see I can create them the way I normally do or I can create a powerpath VG.

Which is the best way to setup the server? I have a CX500 2 HBA's going to an EMC fibre switch with two HBA's from the host, the system see four devices per lun, 2 on FCS0 and 2 on FCS1.

Thanks for your input.
Vince
