Hi,

I would ask you gladly, what your way is regarding the future of PSSP. The support for PSSP ends 01.09.2007 and now I consider whether one is to change to csm-cluster or to standalone nodes and use only nim (for user management and installation images).

In the moment I use PSSP only for event monitoring, user management and installation/customizing from the nodes. I think user management and installation/customizing runs over default aix nim and PSSP-event-management can I replace through WSM (Web-System-Management) from AIX.

Which reasons are there for migrate from PSSP to CSM?

Advantages and disadvantages?

What is your opinion?

Best regards,
Frank Mueller
