I have a P655 running AIX 5.2. Web guys wanted to move web server off older box (AIX 4.3.3 ML11) running iPlanet to the P655. Corp-IT has dropped iPlanet for Apache. We wanted to do the same. Tried to install IBM's Apache implementation off the Bonus CD that came with AIX 5.3 base CD's. Could not figure out how to install, since not really a LPP package. Somehow, I think I got it to install, but web-master says it does not run correctly. Gives errors about can't find dynamic libraries.

So, want to just start over!

Where should I get Apache for AIX 5.2?

How should I install it? (Found a site to download real Apache for AIX, but it was an RPM.)

Any other info you care to share.

Thanks,
