Hi,

When setup an AIX 5.3 (ML02) NIM server and setup an AIX 5.3 lpp source.
When we build a machine from it, everything runs fine. But when we login
into the server, it is like the customization script was never run.

Yet, if we run showlog, we can see the output of the script we ran....
Could it be that the script is ran against the SPOT that's NFS mounted
during the install, instead of applying to the local disk that was just
installed ?

We've never run into this problem with 5.2.

Thanks.

Yves.
