go into maint mode, add an entry for root in /etc/passwd... ensure that system group is in /etc/system, ensure that login=true for root and then reboot. that will get you into the server to restore/rebuild the rest of the file.

No.

> how do you know the file is ZERO length?

I know just because I cannot get in and examined the script it ran. Script would result 0 /etc/passwd file. Too late though.

Good morning everyone

Now I've got a chance to practice AIX disaster recovery: one of the scripts smoked /etc/passwd file, to zero. Machine is micropartition, freshly installed but due to some reasons rebuild is not an option. Could you please advise how to I recover from this situation? (Way to boot to single user? Mount rootvg and restore passwd from other machine?)

Thanks in advance

Dmitry
