All:

I am having an issue with a flash process that I am unable to identify..

My source server has two volume groups
My target server has the same two volume groups

During the flash process, I unmount and varyoff the two volume groups on both the source and target systems.

I run the flash task

Then varyon and mount the filesystems on both the source and target systems.

My problem:

On the target system, when doing a varyonvg to volume group #1 I am receiving the following error:

0516-070 lqueryvg: LVM system call found an unaccountable internal error
0516-932 /etc/syncvg: Unable to synchronize volume group rdf1vg.

Notes:

- a) After the flash process completes, the volume group rdf1vg is varied on successfully with no stale partitions
- b) I am able to run a syncvg with no errors
- c) I am able to unmount, varyoff, varyon and mount (without doing a flash) and I do not receive this error
- d) The flash process itself completes successfully with no errors on the flash task
- e) I have completed a reverse flash on the system (with the same error during the varyonvg for the target system) and the data itself is fine
- f) using Big Volume Groups (no where near the 128 max limit)
- g) export and import works fine on the target system

Anyone else run into an issue like this? Or suggestions on where to look for a resolution...

Tks
Tina
