I am trying to duplex-print a file, from an AIX 5.2 machine, on an IBM info-print 32, using the following command.

```
qprt -da -#v -#j -Y1 -Pinfo32pcl somefile
```

The file being printed contains ctrl-L formfeed characters, which seems to invalidate the -Y1 duplex option. With each ctrl-L a new side-one page is started. The only time text is printed on side-two is when the number of lines on the page exceeds 60.

If I remove the ctrl-L characters the document prints on both sides of the paper (although not formatted as I want). I suppose I could add blank lines to my the file, such that each page contains 60 lines.

Does anyone know of a way out of this.

Thanks....grant
