All:

I must be brain dead today... I have a runaway processes that is apparently filling up my root directory – holding on to an inode. I did a compare of the actual files in root before and after the filesystem increases and there is no difference... I believe someone removed a file without killing the process itself... but I can't seem to find the process on the system that is causing the issue...

Ideas...

lsif (if installed)

fuser /dev/hd4
