We are testing Business Recovery for one of our production AIX 5.2 servers, and want to prevent outgoing FTPs from the BR server. Commenting out FTP in inetd.conf just blocked the incoming FTPs. Restricting the permissions on the file /usr/bin/ftp works, but does not guarantee that all FTPs use that file. Any suggestions?

Also, is there a way to restrict out-going FTPs from a particular server while allowing them to others?

Ed
