On AIX 4.3.3, installed Samba 3.0.4 obtained from the Bull free ware site.

However, executing this command :-

```
smbclient -L hostname
```

produces the following error :-

```
exec(): 0509-036 Cannot load program smbclient because of the following errors:
```

```
0509-150 Dependent module libreadline.so could not be loaded.
```

```
0509-022 Cannot load module libreadline.so.
```

```
0509-026 System error: A file or directory in the path name does not exist.
```

Anyone seen this before? If so, what resolution was found?

Also, is there recommended a Samba version for AIX 4.3.3..I recognize that the latest Samba version will not run on AIX 4.x

TIA
