I'm looking to mount a Windows share from the AIX box.

Russ

Subject: Re: Microsoft Services for Unix

Hi Russ

Could you elaborate from where to where you try to access / provide Data ?

1. In case you need to access Data on the Win Server from the Unix box:

NFS is the name of the Protocol used, you need SFU and must define a NFS share on the Windows Server, and execute a NFS mount on the Unix box

2. In case you need to access data from the Unix box on the Windows Server:

simplest is to run Samba on the AIX box. Samba provides the Win protocol CIFS then your goal would be to access a samba share on the AIX box like any other windows share.

i do not know exactly if SFU would also allow a NFS mount from AIX "NFS Server" to Windows SFU Server ( NFS Client ), because most times it is used vice versa like mentioned in the first part of this mail.

just a pointer for which topics you can look  
Micha
