Admins,

I currently use Reflections and or Humming Bird to access my remote AIX 5.2 servers. I can do everything needed from there by exporting the display if needed. I would like to activate CDE for a few users to use and want to know if anyone has a document on this. I am not sure if I would control this via "src" or if there needs to be any type of rhosts file or any specifics since it is not currently setup. Thank you for your help.

Larry
