"Kip Macy" <kip.macy@xxxxxxxxxx> writes:

What if, rather than putting `ifndef XEN` in 10 or 15 files, I instead added "native" to `options.i386` and marked all those files as "native" in `files.i386` and then put "native" in `DEFAULTS`. That would allow me to simply add "nooption native" in a XEN kernel config and disable their compilation without touching the files themselves.

or "legacy" perhaps, rather than "native". It would also be useful for anyone trying to run FreeBSD on a so-called "legacy-free" machine that doesn't have a PC-compatible BIOS (many thin clients for instance)
