I was running with just the kernel option, and nothing configured for it. I can't think of what else the problem could be, when I recompiled the kernel it just started working again, it might not have anything at all to do with ACL's and more to do with the fact that I just recompiled it. One of my other -CURRENT machines is working now as well after a recompile. I'll do more testing to see if I can pinpoint the problem and I'll probably have results by Tuesday (holiday weekend :-P)

Ken
