In my continuing quest to figure out what's wrong with ACPI in -CURRENT on my laptop, I've tried going back to the old ata drivers (worked, but made no difference), ended up blowing my computer up (weird fsck problem crept in), went back to 5.1, moved up to -CURRENT again, and started plugging away at this problem again.

I'm still not sure what's causing it, but I think I've found where it's hanging now: `acpi_cmbat_get_bif()` in `acpi_cmbat.c`. I'm putting more debugging statements into that file to see if I can narrow down exactly where it's hanging, but it looks like the problem is somewhere in there.

Any ideas what I should be looking for?
