I've noticed lately a lot of "succeeds port" messages when I run portversion (from the portupgrade port) to list which of my packages are out of date and require updating. These messages are incorrect (i.e., the "port has" version identified by portversion is older than that in the actual port Makefile), and I don't get incorrect identifications from either pkg_version or portmanager. (I also don't get this problem on a RELENG_6 system I have, either.)

After a little looking, I discovered that my /usr/ports/INDEX-7 file is not being updated. Investigation of the portsnap source reveals that it only actually generates INDEX, INDEX-5, and INDEX-6 from portsnap updates in extract_indices(); it doesn't generate INDEX-7.

Workarounds until portsnap does it again, in order of length of time to generate INDEX-7:

```
cd /usr/ports ; make fetchindex
cd usr/ports ; make index
pkgdb -U
```

Should usually be good enough:

```
setenv INDEXFILE INDEX-6
```
