Although, I don't know if the "cheap" SSDs mentioned can compete with the SD-RAM backed "super SSDs".

On a mostly unrelated subject, I'd just like to post this link for the people following the thread:

<http://gizmodo.com/gadgets/peripherals/hyperdrive4-is-a-ram-hard-drive-fast-as-lightning-335274.php>

I was not talking about that level of hardware :)

Hey, that's cheap.

Thanks for the link.

Their comparison with TMS's RAMSAN is a bit unfair, though. A good part of the price-difference between the two comes from the fact that the later connects via FC and it's actually a small SAN-array (hence the name). Makes all the eSATA-crap unnecessary and allows for easier sharing of the device.

But still, the Hyperdrive looks promising.

The problem is: our servers don't come with 5.25" bays anymore – we've long since left that form-factor behind....

cheers,
Rainer
