In order to eat my own dog food, I upgraded my laptop from 6.2 to 7.0. This seemed to have gone well, until I started writing a long e-mail while sitting on the couch today. As I was typing the e-mail, I noticed that my typing skills seemed to have gone missing; there were words missing 2-3 letters, and other places where I was apparently holding down keyyyys. Heh, that's a real example of the phenomenon right there.

There were a variety of similar-sounding problems reported as part of the X.org 7.3 upgrade but I thought they'd been fixed. (Rummage around in the -x11 and -ports lists during September for details).

Someone else just e-mailed me a link to that thread, I'll take a look and see if the problem seems to be the same.

Do you see similar problems with VTYS?

I didn't notice the problem until after I started travelling for the holidays. I'll experiment with sshing into the box when I return home later in the week.
