Hello,

good news if the machine starts correctly !

the next step is finding the conditions when the machine does not start,
and get a verbose log.

<http://elcom.ru/~masm/boot-gsvh.log>

Problem with 2Gb of memory? WinXP startup and work correct. Without
hw.physmem="1G" kernel don't start and no any log can be made.

then try other values : 1500Mb, to see where it stops

it is your machine, and you are the only one who can try different
combinations.

you say that the kernel does not start if you remove hw.physmem="1G" : maybe
the loader has troubles with the memory map from the BIOS ?
