The focus management and the highlighting of the window manager decoration are not physically connected in any way, so a bug in the window manager might cause it to do the highlighting but forget to give the focus to the application.

But mouse focus and keyboard focus are the same, right?

There isn't a "mouse focus". Mouse events are tied to window they happen in, not the one with focus. If you use a window manager that doesn't change the keyboard focus on mouse events, it's possible to have mouse events happen in a window that doesn't have the focus.

Ah, good to know. That changes things somewhat.

Greg
