Hi,

I am writing some code that is using the systems ifnet structs via `ifnet_byindex()`, I have two network interfaces :

broadcom BCM6750A1M using the 'bge' driver  
Intel PRO/wireless 2915ABG using the 'iwi' driver

I have written some code to output the `ifnet->if_type` for each interface and it shows that both have type 6 (`IFT_ETHER`).

My question is why do they both have this type when there are `IFT_GIGABITETHERNET` and `IFT_IEEE80211`? I was planning on using this value to distinguish what sort of connection each interface is using but obviously with both returning `IFT_ETHER` this is not possible, any help is much appreciated!

Cheers  
Matt
