Hi,

If you can package up some kind of test or analogous workload that I can run, I'd be happy to take a look at profiling it on MP hardware.

Should be possible. Btw. Has setting kern.threads.virtual_cpu to a different value effect for running programmes or just started ones ?

P.S. I assume you've done all the usual things like using libthr instead of libpthread.

Yes, all clamd installations we have run with libthr, since libpthread is completely unusable and libc_r has small hangs from time to time. The question is just if this is a clamd problem or an threading library problem.
