2. As I said before initial subject of this project was "Distributed audit daemon". But after some discussions we had decided that this project can be done in more general maner. We can perform distributed logging for any user-space app.
[...]

This sounds very similar to syslogd. Is it feasible to make dlogd a drop-in replacement for syslogd, at least from a syslog-using-program point of view?

Our project concentrates on log shipping. We're paying most attention to securely and reliable log ships. So our project differs from syslogd in major way.

But actually it could be possible to be dlogd used by syslogd\syslog-ng for logs shipping, as I see it. I.e. consider this scenario.

(client syslogd) <-> (API) <-> (client-specific part of dlogd)

^^
||
vv

(network channel)

^^
||
vv

(server syslogd) <-> (API) <-> (server-specific part of dlogd)

But server-side communcation (i mean server-side syslogd <-> API <->

Re: SoC: Distributed Audit Daemon project

dlogd) will need more thinking. I'm not going to think of implementing this kind of feature this summer but I'll consider it later for sure.
