Not disputing your answer, but I'm curious. Why would it cause problems on some systems but not others? I haven't done anything with my cflags ...

It depends on how much RAM + Swap do you have. I know people with 1.5Gb that have such problem and others with 2.5Gb that haven't it (if I remember correctly the amounts). The "bug" is the un-optimized optimization :-). There is already a patch that will be included in 4.2.1 release, but I hope will be backported before in FreeBSD gcc.

Ok, this makes sense. I was interested in the original post because I also have 2G of ram, and very little swap configured, so it looked to me like the only variable was that he had ZFS and I didn't.

Doug
