hi all, i have to servers (A, B) with round robin DNS, users enter to server A and server B and they write to a txt file, how can i sync the file from both server so it can be always the same? for example if a user enter to server A and modify some data, replicate that modification to server B so when user enter to server B he can see his changes, and the same if user modify a file on server B, replicate that file to server A, any idea?
