Greetings,

This might no longer be a good place to ask this since so few of us actually use modems anymore, but...

I am wondering which of the multiple serial port cards is best supported/maintained in FreeBSD. I am also concerned with expandability...

A customer with a server running about 20 dumb terminals plus some PCs on a network, wants to put a box in a satellite office to run 4 or 5 terminals and a printer. They also would like a new report system and we are looking at setting up a box with about 32 modems hanging off it's backside for faxing and dumping directly to onsite modem/buffer/printer units.

So:

- support for 8 upto 32 ports
- well maintained driver
- capable of sending 32 simultaneous 19200 or faster faxes
- Not too worried about the price
