Hi,

1) install mysql

2) copy the mysql data directory to say mysql1

So you have /var/db/mysql and /var/db/mysql1

3) Open the first mysql /var/db/mysql/my.cnf

Change

port = <The port you want the first mysql to listen to>

bind-address = <The ip you want the first mysql to bind to>

4) start the first mysql server

5) Open the second mysql /var/db/mysql1/my.cnf

Change

port = <The port you want the second mysql to listen to>

bind-address = <The ip you want the second mysql to bind to>

6) Write the startup command for the second mysql server

/usr/local/bin/mysqld_safe --bind-address=<The ip address you want to bind

the second mysql server to> --user=mysql --socket=/tmp/mysql1.sock

--datadir=/var/db/mysql1 --pid-file=/var/run/mysql1.pid &

This works great for n number of mysql servers. Tested and working on one of my live servers.
