On FreeBSD 4.x I used the old SCO client to back up my FreeBSD boxes, which worked great for my needs. However, I just installed my first FreeBSD 6.0 box, and have having some problems making it work. Here's what I get:

```
mtibor@mailxf$ /usr/adsm/dsmc
Abort trap: 6
```

Doing a kldstat verifies that `ibcs2.ko` and `ibcs2_coff.ko` are both loaded.

I don't know if installing `/usr/ports/misc/compat4x` would help - I guess not, but it might be worth a try.

I'd missed that--I'll give that a shot.

Perhaps you should raise this on `freebsd-stable`, as you might be more likely to find a fellow SCO user or someone interested in tracking an `ibcs2` regression.

Good suggestion, I'll do that as well.

Thanks very much!  
Mike
