

Can sendmail listen for SMTP on two prots at once?

Can sendmail listen for SMTP on two prots at once?

I am trying to work out a roaming solution for clients with notebooks that don't like webmail and need to send outgoing emails via one of our SMTP servers. At the moment I have a POP before SMTP solution running which works fine except more and more the clients are finding that outbound port 25 in the hotels they stay at is blocked. I was trying to come up with a way to get sendmail to listen on two ports at once the normal port 25 and a port number above 1024 for the roaming users.

Anyone have an idea how to achieve that or another roaming suggestion to bypass the hotel blocks?

– Ernie.
