- 

I have a few hundred VIP clients (yes, some are more VIP than others) who I'd like to notify, via SMS, whenever we have any network problem and also immediately such a problem is resolved.

What I'm looking for is some software that I can use to do this, within FreeBSD. I hope one of the experts in this area has done one so I don't have to wait for the invention.  
`make search key=sms` from within the ports did give some apps, but I did not see one that is capable of looking at a database of contact numbers and sending that one sms to all of them. Of course I do expect a reply/delivery report after sending the sms.

Any good pointers will be appreciated.
