Hi,

I know that it is possible to configure BigBrother (<http://bb4.org>) in such a way.

BB is basically a software to monitor the availability/reachability of IP addresses, services, processes, etc..

In case of an outage you configure it to send a mail (maybe to some mail2sms gateway?).

I would second the recommendation for BigBrother, although they have been drifting away from being a completely open license to being more commercial and your circumstances might require you to buy a copy...

Nessus might be another choice, although I don't know how to make nessus do SMS-oriented messages, whereas BB generates simple messages to SMS and has the web page with more complete info.
