I need to put a couple network sniffers on our network. The purpose is to track and log usage. I would hope to discover everything from "who is viewing what website" to typical network trends about usage. I would expect having a span port on a switch forwarding all traffic to a nic on the box listening promiscuously. Something that put it into nice web-viewable tables/stats would be ideal, but before I go trying to re-invent the wheel...

It just seems like something that would be "out there".

I was wondering if there is something out there (preferably open-source, but not necessarily a requirement) that some folks use and are reasonably happy with?

thx,

mike
