| the more stable and reliable choice for an ISP. Especially as an email
| server.

| What is the best way to manage the addition of new users to the email
| server? local users or is there a database solution. Also is there a
| software package available to easily administer email accounts or does
| it all have to be done with custom scripts.

| I would welcome any suggestions of anecdotes of experience.

Linux or FreeBSD, I am putting in a good word for @Mail – if you want commercial software. It relies on Exim+Courier+imap+SpamAssassin+Clamav.. (www.calacode.com)

Linux only – Try the Open Source version or even the commercial version of Zimbra (www.zimbra.com). Zimbra is not my first priority though.

For pure open source (uses Exim, courier, SA, DSPAM, MySQL) try <http://silverwraith.com/vexim>). I have run this for years with over 2000 domains, each with average 10 users!
