Michael Schuh wrote:

Hi @list,

i search a good/reliable/stable possibility to manage  
Domains/users/mailaccounts/webospace/servers etc.  
per Http...

I have searched throug google and the ports-tree and the only  
two frontends that i have found are sysutils/syscp and www/raqdevil.

syscp shows me very clear and a little bit poor but stable and mature enough  
to use it.

raqdevil is horridble to install clean and runnable in a jail,  
and it uses originally code from SUN Microsystems Cobalt-Raq's,  
so that it seems to me a little bit difficult to use it.....

Can anyone point me to other frontends ( preferred supported through the  
ports-tree),  
and/or to an frontend to cfengine ( if it gave one)?

Thanks for all

regards

michael

I had an email front-end custom built for myself by a top notch php/mysql programmer.

eemam

<http://www.eemam.com>

he can create any interfaces you desire and is a very reasonably priced and  
experienced programmer.

I use exim/vm-pop3d and the system works great for the 100 or so domains which I host.
