Hi @list,

(i would answer to the list, not to the persons only)

First thanks for the suggestions.

Now my personal opinions:

I like solutions that ar small, smart and easy to administrate/update.  
Such as syscp. But syscp doesn't have all the functionality that i like.  
dnc looks very good, but have tons of dependencies that are not really  
needed.  
raqdevil shold be a good solution if it get installed right, but it doesn't  
in a jail.

webin is overloaded, while the customer from me doesn't like a fully system  
management, and in the last twelve years of my experiences with  
linux/freebsd

i have many many boxes seen that have been cracked and misused as  
mailgateways/streamingservers  
or public ftpservers from crackers. because the updates from webin are not  
all times  
maked fast enough.

qmail is good but for me it is a little bit to complex to handle,  
i prefer combinations such as  
named(bind9)/postfix/sa/dspam/cyrus-imap(also with murder-config) or courier  
or dovecot for small  
enviroments. for Databases i like to prefer postgresql before mysql and  
apache or lighttpd.

And that are the components that i have to manage over a single webfrontend..

So that at this moment syscp is the only one that can handle this and only  
this,

not more and not less, but it lacks of support for sa/dspam.

ok dspam brings his own webfrontend but sa not and sa is very complex  
to configure while it has tons of features.....so i think about it to leave  
it out from

the box and use only dspam.....

Re: ISP Webfrontends for Management

the webfrontends for cyrus are not really good IMHO

thanks for your suggestions

regards

michael

Michael Schuh wrote:

Hi @list,

i search a good/reliable/stable possibility to manage  
Domains/users/mailaccounts/webospace/servers etc.  
per Http...

I have searched throug google and the ports-tree and the only  
two frontends that i have found are sysutils/syscp and www/raqdevil.

syscp shows me very clear and a little bit poor but stable and mature

enough

to use it.

raqdevil is horridble to install clean and runnable in a jail,  
and it uses originally code from SUN Microsystems Cobalt-Raq's,  
so that it seems to me a little bit difficult to use it.....

Can anyone point me to other frontends ( preferred supported through the  
ports-tree),  
and/or to an frontend to cfengine ( if it gave one)?

Thanks for all

regards

michael
