Hi All!

I have a linux gateway server (using iptables on this) where my client hit first. I want to direct the http traffic to the proxy server based on FreeBSD (i mean transparent proxy). I am using FreeBSD 6.2 and Squid proxy 2.6. I have directed the http traffic from my linux gateway server to the proxy server on FreeBSD as below. But the transparent proxying does not work. Is there anyone worked with the issues on transparent proxy with FreeBSD 6.2. who may suggest in this case?

```
/sbin/iptables -t nat -A PREROUTING -s 192.168.40.0/24 -p tcp --dport 80 -j  
DNAT --to 172.16.3.1:8080  
/sbin/iptables -t nat -A PREROUTING -s 192.168.40.0/24 -p tcp --dport 8080  
-j DNAT --to 172.16.3.1:8080
```

Regards,

M
