

IPSEC in tunnel mode (possible?)

Hi everyone,

I know it is kind an off-topic question but maybe another network admin have already faced the following:

```
client--[__ipsec__]--gw--[__ip__]--internet
```

I, trying to secure a wireless link, want to have my clients using ipsec on the segment between the gateway gw and the machine itself even when the traffic is to the internet and not only to the gateway (what works fine in transport mode anyway). The clients are windows machines.

Accordingly to Microsoft 252735 tunnel is possible when a windows is acting as a gateway, not our scenario where machines are only clients...

Any one could point me to some url or send me keywords I should look for please? If things won't work with ipsec I'll do it with MPD... but I still should have ask it here.

Thanks in advance (and sorry for the cross posting),

--

```
