Hi freebsd-net@ folk.

I've been having problems trying to simultaneously configure my 4.9 home client gateway & my remote 24/7 server to provide an Auth + SASL outgoing sendmail channel. My fault not FreeBSD's but I'm asking for help. One problem is I dont have a known good server or client to test the other half against. Another problem is too many options – each end :-)

I'd much appreciate if some kind volunteer could either:

- A) Give me a temporary account for my sendmail client on their server (not even a login, I've got plenty of those thanks, just a `proper' SASL + Auth + Sendmail, (& it's easy to check I'm not a spammer seeking a relay, hit Google with my name & you'll see what I'm known for, better or worse :-)
- or B) I give you a temporary account on my half baked server, you point your client at it, wait for it to blow, & tell me what I've got wrong (Yes I can give you a full login so you can look yourself if you want.)

Whichever, if either or both I'm offered please :-)

I've read lots of docs, not restricted to (but just listing some)

</usr/share/sendmail/cf/README>

<http://docs.snake.de/smtp-auth.html>

<http://home.leo.org/~barner/freebsd/articles/mailsetup/article.html>

<http://www.sendmail.org/~ca/email/cyrus/sysadmin.html>

[http://www.freebsd.org/doc/en\\_US.ISO8859-1/books/handbook/smtp-auth.html](http://www.freebsd.org/doc/en_US.ISO8859-1/books/handbook/smtp-auth.html)

& tried SASL2 & then SASL1,

Ive tried SASL passwords & direct /etc/passwd type.

I think I've tried most or all of

ports/security/ cyrus-sasl cyrus-sasl2 cyrus-sasl2-saslauthd

but I think not yet

mail/sendmail-sasl

My background .m4 files (both ends) are mastered from

<http://berklix.org/~jhs/src/bsd/fixes/FreeBSD/src/jhs/etc/sendmail/common.cpp>

My current error report is server end: AUTH warning: no mechanisms

freebsd-net: Auth + Sendmail help please

>From contrib/sendmail/src/srvrsmtplib.c:3992

I have all of

/usr/lib/sasl/Sendmail.conf -> ../../../../site/usr/lib/sasl/Sendmail.conf

/usr/local/lib/sasl/Sendmail.conf -> ../../../../site/usr/lib/sasl/Sendmail.conf

/usr/local/lib/sasl2/Sendmail.conf -> ../../../../site/usr/lib/sasl/Sendmail.conf

Are symbolic links acceptable ?

Can Sendmail.conf contain comment lines beginning with hash char ?

Any help appreciated, please ! Thanks !
