Hi all,

i need to build internetworking routers on FreeBSD, OpenBSD and Linux platforms servers. Becasue of this i need a multiplatform software implementation of routing protocols.

I tryed routed(8), but there are differences between the *BSD and the Linux versions which break my aims.

I also know about zebra, but it's current version is 0.94 and this lead me to think it's not good enough.

Could someone point me to a good multiplatform implementation of routing protocols ?

Thanks in advance!

Vladmir
