Okay, to be sure, most of them are IPv6 routing entries, right?

Then please provide some additional information.

1. the result of netstat -rnal. A digest of the output is probably enough, but if you could provide the entire output (on the web, for example) it would also be helpful.
2. how did you configure the route to the stf interface? I guess you installed some static route for 2002::/16 to the interface. The command line argument (or the rc.conf parameters) that made the route and the corresponding route entry shown by netstat -rn are both helpful.
