

Multicast not working as it did(?)

Hello,

I'm trying to make wpa_supplicant work with wired drivers in FreeBSD (see [1] too).

I copied some code from mtest (last updated 3 years ago, but still present by default) and ran into a problem.

When deleting a multicast address that was added with SIOCADDMULTI FreeBSD spits up a NOENT. All I can think of is that the address never got added. This seems to be possible, since my modified wpa_supplicant driver does not receive any packets.

This behaviour is tested with 3c905TX (xl) and a Davicom 902 (dc) card. Any help on this issue is welcome, I suggest a review of mtest.c for the latest versions of FreeBSD.

regards,
– Jouke
